Excerpt from A Preliminary Investigation of the Soil and Water of the Fayum Province Method of collection of the samples. - A hole was dug to the required depth (20 cm. In most cases) and a vertical slice of uniform thickness was cut away from one of the sides. This was put into a cotton bag and constituted the sample. Treatment of the earmples in the Laboratory before analysis. - The whole of the sample was put on to a zinc sieve having round holes 3 mm. In diameter, and sifted as long as anything passed through. The lumps left behind were then transferred to a mortar and broken by gentle pressure with a pestle, care being taken to avoid crushing any of the stones present, and again sifted. This treatment was repeated until nothing was left on the sieve except stones and rock fragments, which were rejected. The several fractions that passed through the sieve were well mixed and transferred to a glass bottle, from which the portions required for analysis and for the moisture determination were taken.
