TABLE III Sagger Clay (James P. Prall, Woodbridge, N. J.). Effect of Addition of NaOH to the Clay (A) in the Crude State; (B) After Removal of the Soluble Salts by Long Dialysis with Water (A) The table shows that there is a decided difference in behavior toward NaOH of the crude clay and of the clay from which the soluble salts have been removed. In presence of the greater concentration of NaOH the liquid seemed to change to a thin jelly, which thickened as the concentration increased; concurrently the bulk of granular sediment seemed to shrink and finally almost to disappear. This is attributed to the fact that the thickening gel is able to hold in suspension progressively coarser grains, until finally gel and grains become intimately and uniformly mixed. On the diagram (Fig. 3) the total volume occupied by this mixture of gel and sediment is given by the line marked recoagulated.
