Environmental has microbially emerged an extremely active, - and important area of research during the few years and has challenged the long-held of For example, the number of colony-forming units obtained on agar media have ways been assumed to reflect the number of bacteria present any given sample. However, now known that many bacteria the laboratory adapt unusual dormant states when subjected to the nutrient-limited conditions many ecosystems, which, turn, makes the selection to culture. Thus our current to culture the vast majority of bacteria known to reside natural environment. Knowledge of the presence of some species a natural environment can be of crucial importance, with particularly respect to detection of pathogenic or to monitoring the fate and of manipulated genetically organisms within ecosystems. Therefore, there has been much effort generated to develop new and novel methods for detection, and recovery of organisms from natural habitats. Central to many of these methods has been the development and application of the techniques of molecular to environmental biology. These have resulted directly from the use of DNA without the need for any culture. There is doubt that would not have been without the revolution in computer technology that has to the development of databases accessible highly of vast amounts of information. Molecular methods have been harnessed and exploited also the development of methods that enable rapid and automated of microorganisms from natural environment.
