Not illustrated. 1855 Excerpt: .nature of the curve of constraint when the particle is subject to the action of gravity, and the direction of uniform acceleration is horizontal. A notice of this problem may be seen in the Bulletin des Sciences de Bruxelles, Tom. ix. (3) To determine the curve down which a particle may descend by the action of gravity, so as to describe equal vertical spaces in equal times, the tangent to the curve at the point where the motion commences being vertical. Let 0 (fig. 149) be the point where the motion commences, Ox the axis of x touching the required curve OA at 0, Oy the axis of y at right angles to Ox; let OM=x, PM=y, /3 = the invariable velocity of the particle parallel to Ox. ds Then = C + 2gx, C being a constant quantity, ds dx n n dJW=C+2Vx But = /8; hence But, when x = 0, = 0; and therefore dx 0 X y 3/3 X no constant being added because x = 0, y = 0, simultaneously. The required curve OA is therefore the semi-cubical parabola, 0 being the cusp, and Ox the axis. This curve is called the Isochrone. It was proposed by Leibnitz1, as a challenge to the disciples of Des Cartes, who, from an excessive attachment to the geometry of their master, affected to despise the methods of the Differential Calculus. No solution was communicated by any of the Cartesians. Huyghens alone successfully accepted the...
