

Effects of respiratory stress on plasma prolactin concentration

Filesize: 6 MB

Reviews

This publication is definitely not simple to begin on studying but quite fun to see. It really is full of knowledge and wisdom I am just effortlessly can get a satisfaction of studying a created pdf.

Diplom.De Mrz 2002, 2002. Taschenbuch. Book Condition: Neu. 210x148x5 mm. This item is printed on demand - Print on Demand Titel. Neuware - Doctoral Thesis / Dissertation from the year 2001 in the subject Medicine - Public Health, grade: 1,0, Sport Academy Cologne (Sportwissenschaften), language: English, abstract: Inhaltsangabe:Abstract: Apart from its actions on reproductive processes, prolactin (PRL) plays a role in maintaining the constancy of the internal milieu by regulation of the homeostatic processes. The present investigation focuses predominantly on the relationship between ventilatory acid-base imbalances and PRL secretion. In four studies different forms of respiratory stress were selected: inhalation of increased oxygen concentration, inhalation of increased carbon dioxide concentration, voluntary hyperventilation and repeated high intensity exercise. It was hypothesized that hyperoxia, intensive exercise and inhalation of increased CO₂ concentration cause an augmentation of CO₂ partial pressure at the central chemoreceptors of the brain, leading to an increase of ventilatory drive based on serotonergic system activation and thus enhanced PRL secretion. In contrast, increased CO₂ elimination due to voluntary hyperventilation should not affect PRL secretion because the decrease of CO₂ partial pressure does not affect PRL release per se, but only after serotonergic system activation due to initial hypercapnia. From the results of the present study it is concluded that an increase in PRL secretion is associated with progressive alkalosis under hyperoxia breathing. Decreasing CO₂ by hyperoxia is related to hyperventilation. The findings coincide with similar results in previous studies by Becker et al. (1996). Transient initial hypercapnia in cerebro spinal fluid after short-term hyperoxia due to the Haldane effect was shown to be the most important mechanism increasing alveolar ventilation (Haldane, 1965). During the rebreathing test of our study, increase of pCO₂ induced respiratory acidosis which lead to hyperventilation and PRL increment. Metabolic acidosis resulting from high intensive exercise...
