Explain how there comes to be a definite locus when we have two variable parameters (the radius of the circle and the latus rectum of the parabola). The equation of the locus in 7866 is (1), referred to polar coordinates with S for pole, $r = c \tan i 6$ or $r = c \cot 6$, which two equations represent the same curve; (2) referred to rectangular coordinates with 0 for origin, cular cubic is the inverse of a rectangular-hyperbola with respect to a vertex, and the pedal of a parabola with respect to the foot of the directrix. Generalized by Projection, the theorem is as follows: --A conic U is inscribed in a given triangle ABC so as to touch BC in a fixed point a, and a is the point on BC harmonically conjugate to a. On Aa is taken a fixed point 0 and a second conic V described touching OB, OC at B and C; prove that the points of intersection of common tangents to any two such conies lie on a fixed cubic having a node at 0, touching Aa at A, passing through B, C, a, and whose tangent at a meets AO in a point which divides Oa harmonically to a. Also, explain how...
