For a number of years the Forest Service has been conducting experiments on the preservative treatment of fence posts, poles, and other forms of timber exposed to decay. These experiments have been made in cooperation with agricultural experiment stations, farmers, and various companies, and also upon the National Forests. They have proved conclusively that when a suitable preservative treatment is given the resistance of wood to decay can be very much increased. Decay. Decay is not due to the chemical action of the soil or to the fermentation of the sap, but is the result of the action of certain low forms of plant life called fungi. These consist, for the most part, of very fine thread-like filaments, collectively called mycelium, which penetrate the wood in all directions. Certain substances in the wood constitute the food of the fungi. As these substances are dissolved the structure is broken down, until the wood reaches the condition commonly known as rotten. The mycelium usually grows out to the surface to form compact masses called fruiting bodies. Since there are many kinds of fungi, there are many kinds of fruiting bodies. The various forms of toadstools, punks, brackets, or dog ears, which are so frequently found growing on trees and deadwood, are examples of these (see figs. 1 to 4). Their presence generally means that decay has made considerable progress in the wood. The function of all fruiting bodies is to produce spores, which are to...
