Excerpt from A Logical Framework for Solid Object Physics The second difficulty is that a useful AI system must degrade well under limitations; it must be able to derive useful partial results from incomplete and imprecise problem specifications. An AI system must be able to produce a crude analysis even in where exact information as to object shapes or parameters is unavailable or unspecified (the middle of a design process) or too complex for effective use. An AI system must also be able to reason generically about classes of varying problems. For example, if we buy a chicken fence, we want to reason that no chicken, within the range of chicken shapes and sizes, can go through the fence; we do not want to repeat the calculation for each individual chicken. In this kind of qualitative reasoning, human common sense far excels conventional computational techniques. Our task is to create an AI system with the same ability to use common sense to solve these problems. This paper presents a logical framework for qualitative reasoning about solid objects. We will present the structure of a first-order language L in which the physics of solid objects can be described; we will define the semantics of L in terms of a formal model; and we demonstrate the usefulness of L by showing that interesting problems can be solved (qualitatively) by inference from plausible axioms expressed in L . The language L is more expressive and supports much richer inferences than any previous representation scheme in this domain.
