Not illustrated. 1866 Excerpt: .at 651bs pressure, the average is as the pressure, or 651bs: by cutting off at one-eighth of the stroke, the average is 251bs. It therefore follows that as we only use one-eighth the quantity of steam to obtain 25, as we use for the one stroke with steam throughout, we obtain additional power by expansion--indeed, upwards of three times the power, or as 200 is to 65. The annexed figure, Diagram No. 17, illustrates the expansion of steam in the cylinder, and gives a mode whereby to ascertain the pressure at any portion of the stroke. In the figure the steam is represented at the commencement as being at 651bs on the piston, cut off at one-eighth the stroke. The figures 1, 2, 3, 4, 5, 6, 7, and 8, are the numbered divisions of the cylinder. To ascertain the pressure when the piston has travelled either one-fourth or one-third, or any other portion of the stroke, the pressure in the first division must be divided by the number of divisions, or portions, whose pressure is required to be known. Thus, if the pressure be required when the piston has travelled half the length of the cylinder, we must divide by 4, the piston having travelled four parts out of the eight into which the cylinder is divided. So also with each division, or number of divisions. Where the expansions are either less or more, the cylinder must be divided accordingly into the same number of...
