

Micropollutant Biodegradation: Prospects for Wastewater Treatment

By Acosta Pelaéz, Andrés Camilo

Condition: New. Publisher/Verlag: AV Akademikerverlag | HPLC Study and Isolation of Strains with Potential for Degrading/Biotransforming Ortho-Substituted Aniline Analogs | The effect of persistent chemical compounds, such as pharmaceuticals or endocrine disrupting compounds, and of their transformation products (TPs) in water bodies entails an ecotoxicological concern. The advances in analytical technology, namely High-Performance Liquid Chromatography (HPLC), have allowed the detection and quantification of these micropollutants, thus enabling the study of their occurrence. Moreover, although most Wastewater Treatment Plants (WWTPs) are not designed to remove these compounds and their performances are often limited, increasingly stringent discharge limits are expected. To overcome the problem, advanced treatment processes could be considered, but limitations are posed due to maintenance and operational costs. Hence, biodegradation is considered to be one of the most promising technologies due to its low cost and potential for complete micropollutant removal. This project focuses on the investigation and elucidation of the parameters that regulate the biodegradation of target micropollutant, such as Ortho-substituted Aniline analogs, aiming to deliver novel technologies to upgrade WWTPs. | Format: Paperback | Language/Sprache: english | 116 pp.

Reviews

This publication may be really worth a go through, and a lot better than other. It really is written in simple terms and never difficult to understand. Once you begin to read the book, it is extremely difficult to leave it before concluding.

-- **Natalie Abbott**

This book will not be simple to get going on reading but extremely exciting to read through. Yes, it can be play, still an interesting and amazing literature. I am very easily could possibly get a delight of reading a written book.
