Excerpt: . mm., a current which caused a deflection of 30 mm. in the galvanometer, when shunted by 2 x 50 cm. of the rheostat, gave, when traversing the gas from a to c, only a single bright layer at the spot where the sphere bordered on the cylinder. This layer was convex towards the anode. The rest of the space, with the exception of the glow-light about the kathode and of the positive light on the anode, was dark. The latter, as ordinarily, was convex towards the kathode. At a high rarefaction there was in the sphere of this vessel, just after closing the current, a faint luminous mist together with t the luminous stratum at the entrance to the cylindrical tube, and this, after a few moments, became transformed into a second luminous stratum which pushed the first into the cylindrical tube and...
