

Optimal separation of upstream suppliers of vital intermediate inputs by a monopolistic assembler

Filesize: 5.62 MB

Reviews

The publication is fantastic and great. It can be rally exciting throgh reading period of time. I am just very happy to inform you that this is the greatest publication i actually have read in my very own daily life and could be he very best ebook for at any time.
(Prof. Alvis Wuckert)

OPTIMAL SEPARATION OF UPSTREAM SUPPLIERS OF VITAL INTERMEDIATE INPUTS BY A MONOPOLISTIC ASSEMBLER

GRIN Verlag Jun 2013, 2013. Taschenbuch. Book Condition: Neu. 210x148x4 mm. This item is printed on demand - Print on Demand Neuware - Seminar paper from the year 2013 in the subject Business economics - Supply, Production, Logistics, printed single-sided, grade: 1,3, Bielefeld University, course: dynamic games in industrial organization, language: English, abstract: In our industrialized world we are confronted with very complex goods. Most of them became part of our everyday life like cars, planes and so on. These products consist of several components with high technological requirements to guarantee the quality of the final product. For example, the production of a high developed plane, as the Airbus A380, needs many special single components like turbines, wings, etc. These vital intermediate goods could either be purchased by foreign firms or be produced by the downstream assembler itself, respectively by an owned subunit. A view on the vertical structure among different downstream firms of different products shows that the share in purchased goods from foreign upstream firms varies widely. Since the components are very specific, the number of upstream firms which produce one vital intermediate input is of course limited. In turn, the specific component could be purchased by less, mostly just one, consumer. A turbine manufactured for the A380, for instance, could not be used by another assembler than Airbus. A downstream firm is faced by deciding whether it should either integrate upstream units and become the owner of them or to sell some upstream firms, respectively let them stay independent, with respect to maximize its own profit. To provide an answer to the optimal behavior of an assembler, with respect to integrate or to separate upstream units, I will use a model where the downstream firm is a monopolist in the final good market and needs a fixed number of vital intermediate inputs in fixed proportions to produce the final product. This model...
