This implies that at this temperature the curve $/$, p for the vapour coexisting with solid B is the prolongation of the curve $p/$ for the solution coexisting with solid B. The same occurs at a great many higher temperatures. That a continuation of the lines cp and ep is imaginary, clearly appears from this diagram, as the vapour-and the liquid-line, if both were prolonged, would change places, which is impossible.) Whereas from $/$, to t , saturated solutions are absolutely impossible, at tt the same phenomenon occurs as at $/$; here also the solubility curve $dctq$, the vapour-line de , q and the critical curve bat a q converge and the critical phenomenon is observed with a saturated solution. At higher temperatures a convergence of the three curves can no longer occur and in consequence all critical temperatures between $/$, and $/s$, just as between $/$, and tt , are critical temperatures of unsaturated solutions. If between p and q solution + vapour-solid B be impossible, it is conceivable, as suggested before, that we may succeed in getting supersaturated solutions and observing their critical phenomena. In such a case the dotted critical curve if prolonged might be realized between p and q , so this dotted line is metastable. For a thorough knowledge of the phenomenon a p , r , $/$ -diagram is most desirable and a r , $/$ -diagram indispensable. Both space) In the first communication, Zeilschr. f. Elcktr. 33, GG3,...
