Named graphs are an extension of RDF adding the possibility to assign names to different subsets of graphs. These names can then be used to treat the triples encoding a graph as a resource, making it possible to store metadata for it. Well-defined semantics and serializations are crucial to provide an open and extensible system to 'talk' about graphs. Interesting applications of this include quoting and cryptographically secure signing of named graphs in semantic web, providing provenance information and trust. 12 pp. Englisch.
