

## The Simulated Effects of Wastewater-Management Actions on the Hydrologic System and Nitrogen-Loading Rates to Wells and Ecological Receptors, Popponesset Bay Watershed, Cape Cod, Massachusetts (Paperback)

Filesize: 6 MB

### **Reviews**

*This publication is definitely not simple to begin on studying but quite fun to see. It really is full of knowledge and wisdom I am just effortlessly can get a satisfaction of studying a created pdf.*

*(Alfreda Bradtke)*

## THE SIMULATED EFFECTS OF WASTEWATER-MANAGEMENT ACTIONS ON THE HYDROLOGIC SYSTEM AND NITROGEN-LOADING RATES TO WELLS AND ECOLOGICAL RECEPTORS, POPPONNESSET BAY WATERSHED, CAPE COD, MASSACHUSETTS (PAPERBACK)

To save **The Simulated Effects of Wastewater-Management Actions on the Hydrologic System and Nitrogen-Loading Rates to Wells and Ecological Receptors, Popponneset Bay Watershed, Cape Cod, Massachusetts (Paperback)** eBook, make sure you access the web link beneath and download the ebook or gain access to additional information that are relevant to THE SIMULATED EFFECTS OF WASTEWATER-MANAGEMENT ACTIONS ON THE HYDROLOGIC SYSTEM AND NITROGEN-LOADING RATES TO WELLS AND ECOLOGICAL RECEPTORS, POPPONNESSET BAY WATERSHED, CAPE COD, MASSACHUSETTS (PAPERBACK) ebook.

Createspace, United States, 2014. Paperback. Condition: New. Language: English . Brand New Book \*\*\*\*\* Print on Demand \*\*\*\*\*.The discharge of excess nitrogen into Popponneset Bay, an estuarine system on western Cape Cod, has resulted in eutrophication and the loss of eel grass habitat within the estuaries. Septic-system return flow in residential areas within the watershed is the primary source of nitrogen. Total Maximum Daily Loads (TMDLs) for nitrogen have been assigned to the six estuaries that compose the system, and local communities are in the process of implementing the TMDLs by the partial sewerage, treatment, and disposal of treated wastewater at wastewater-treatment facilities (WTFs). Loads of waste-derived nitrogen from both current (1997-2001) and future sources can be estimated implicitly from parcel-scale water-use data and recharge areas delineated by a groundwater-flow model. These loads are referred to as instantaneous loads because it is assumed that the nitrogen from surface sources is delivered to receptors instantaneously and that there is no traveltime through the aquifer. The use of a solute-transport model to explicitly simulate the transport of mass through the aquifer from sources to receptors can improve implementation of TMDLs by (1) accounting for traveltime through the aquifer, (2) avoiding limitations associated with the estimation of loads from static recharge areas, (3) accounting more accurately for the effect of surface waters on nitrogen loads, and (4) determining the response of waste-derived nitrogen loads to potential wastewater-management actions. The load of nitrogen to Popponneset Bay on western Cape Cod, which was estimated by using current sources as input to a solute-transport model based on a steady-state flow model, is about 50 percent of the instantaneous load after about 7 years of transport (loads to estuary are equal to loads discharged from sources); this estimate is consistent with simulated advective traveltimes in the aquifer,...
