

## Cetartiodactyla

By Frederic P. Miller

Alphascript Publishing. Taschenbuch. Condition: Neu. Neuware - Cetartiodactyla is the clade to which whales (including dolphins) and even-toed ungulates have currently been placed. The term was coined by merging the name for the two orders, Cetacea and Artiodactyla, into a single word. The term Cetartiodactyla reflects the idea that whales evolved from within the artiodactyls. Under this definition their closest living land relative is thought to be the hippopotamus. The clade formed by uniting whales and hippos is called Whippomorpha or Cetancodonta. Alternatively, the term Cetartiodactyla is used to denote a clade where Cetacea and Artiodactyla are sister groups, but where Cetacea did not actually evolve from within the Artiodactyla. Under this definition, all artiodactyls, including hippos, are more closely related to one another than any are to the whales. This group has been proposed as a new order, but there is not sufficient evidence of the exact relationship between the two current orders to efficiently merge them. 116 pp. Englisch.
