The Beehive Effect begins by introducing you to the ancient knowledge of hive location and the electromagnetic fields that enhance a hive to levels of maximum potential. Feral bees locate over high energy zones. These zones which are part of a global electromagnetic frequency emission essential for all life. Humans thrive at the low frequency of about 7.83 Hz. However, earth frequency varies due to underground irregularities such as mineral deposits, wet or dry river beds, faults, lay lines and man-made electromagnetic disturbances. Geologists refer to these zones as geopathic stress. Colony insects refer to them as high frequency zones finding them of great benefit to their vitality and survival. Bees locate over these zones because the energy they emit is free; meaning, i.e., that it does not require work to be absorbed. In quantum physics, all energy exchange is information transfer. Free information transfer is highly advantageous to honeybee colonies of over 80,000 individuals living in a highly-condensed space. At the level of quantum mechanics, free energy reduces the colony s work which extends the vitality of the hive. Work reduction means less caloric intake for tasks that require high caloric expenditure, such as temperature maintenance for comb construction, incubation, winter heat, humidity within the hive and honey, vibratory communication and hive activities, pollination, foraging and protection from disease and parasites. Fundamentally, to perform a task, a spark of electromagnetic energy is required to generate a behavior, hence free energy is more desirable to the colony than food source location. In, The Beehive Effect, the effect of electromagnetic fields on hives is dealt with in depth. However, it is not the first cause that animates the narrative. Primary...
